

Viking Invest

Open-engine retail trading infrastructure — the dashboard, the backtest and the alert are the same code.

The opportunity

Retail traders spend an estimated **\$1.2bn / year** on signal subscriptions, mentorship courses and analyst services across forex, crypto, indices and commodities. Three things are wrong with the current market:

- **Signal services are black boxes.** A Telegram alert says "BUY EUR/USD" with no math behind it. Published win rates can't be independently audited. Brokers pay affiliate kickbacks per trade — so providers are incentivised to fire more signals, not better ones.
- **Analyst services don't scale.** Elliott Wave Forecast (\$99–399/mo) and EWM Interactive sell a human's wave count. Quality is real, but it's one chart at a time and the count can quietly change between updates.
- **Mentor courses sell theory, not infrastructure.** Paul Bratby and similar sell you a curriculum, then you apply it manually on TradingView. The student does all the multi-timeframe work by eye.

*There is no product in this market that gives a retail trader **institutional-grade multi-timeframe alignment, open methodology, same-code alerts and auditable backtests** at the same time.*

What we've built

A live 4/4-confluence trading dashboard covering ~45 instruments (FX majors / minors / crosses, precious metals, oil, the major indices, and the top-10 crypto). One engine produces three surfaces:

Surface	What it is	Who it serves
Dashboard	Live HTML page, every pair scored across four timeframes (1m, 5m, 15m, 1h)	Active trader, watching the market
Backtest engine	Same rules walked over 365 days of OHLC, equity curve and max drawdown	Trader paid up before risking capital
Telegram alerts	Python detector mirroring the JS engine byte-for-byte; alert on 4/4 confluence	Trader who can't watch the screen

The dashboard is publicly viewable today. ~70% aggregate win rate over the documented Apr 2025–Apr 2026 backtest window across the wick-primary cohort. Every rule change is versioned (RULES_VERSION) and the failure-mode panel surfaces hypotheses with sample-size honesty before they're adopted.

Why we win — the five-point moat

1. One engine, three surfaces

Dashboard, backtest and Telegram alerts are produced by byte-for-byte mirrored code (JS `detectIntradaySignal` ↔ Python `detect_intraday_signal`). A subscriber's alert is the same function call that generated the published equity curve. No one else in the retail space does this — competitors split alerts, dashboards and backtests across teams or vendors, so the numbers never reconcile.

2. Open, versioned, auditable rules

RULES_VERSION fingerprint (currently 2026-06-09d), inline change-log, and a live failure-mode panel that lists hypotheses (1H RSI 80/20 gate, fib half-size entry, counter-bar invalidation) with sample size and forward measurement BEFORE adoption. Subscribers can audit the logic; competitors can't even show it.

3. Per-asset-class methodology routing

FX/crypto use wick-extreme entry, commodities/indices use a Fib 38% half-size entry, encoded in `_btProfileFor()`. Most competitors apply one playbook to everything — Viking accepts that asset classes behave differently and routes accordingly. Hidden complexity that compounds the edge.

4. Same-bar invalidation discipline

Pre-trigger invalidation set — stop-breached, opposing-CHoCH, 2× counter-bars, 1H RSI extreme — collapses setups to CANCELLED with a named reason instead of hiding them. Subscribers see the trades we suppressed AND why. Signal services don't — they only show you fires.

5. No broker affiliate distortion

Zero revenue from "join my broker via this link" kickbacks. Standard retail signal services earn a per-lot rebate from the broker, which creates documented bias toward more trades, not better trades. Viking's monetisation will be subscription-only — aligned with subscriber outcomes, not trade volume.

"Competitors sell you their conclusion. Viking shows you the math the conclusion was derived from — and the same code runs your alerts."

Tech & defensibility

The product is deliberately boring underneath — cheap to run, easy to ship, hard to fork once the auditable history compounds.

Layer	Stack	Cost	Defensibility
Data ingestion	GitHub Actions cron · OANDA / Coinbase \$0 (with free API tier)		Multi-source fallback published in code
Engine	Vanilla JS dashboard + Python detector — \$0 (standard npm/js)		Defined rule history once we publish the char
Storage	JSON on the repo + Supabase (auth, profiles, \$2.5/subscriptions)		RLS + admin-only SECURITY DEFINER RPCs
Alerts	Telegram bot, per-user routing by alert class (\$0 - Telegram is free)		Same-engine alerts are the moat, not the channel
Distribution	Public dashboard URL · npm package · GitHub Pages		SEO-friendly, no app-store gatekeeper

Competitive landscape

Competitor	Shape	What they sell	Where Viking wins
Paul Bratby / Trade The Fifth	Mentor + course	Elliott Wave methodology, MT5 indicators, dashboards	Love, don't care education, the work the student does by h
Elliott Wave Forecast / EWM	Analytics service	\$99–399/mo human-curated wave counts	Automation, ~15 markets, audit-trail of every rule cha
AltSignals / Learn2Trade / fxpr	Telegram signal seller	\$40–150/mo curated "BUY EUR/USD"	Clients, transparent code, no

Traction & proof points

- **~70% aggregate win rate** across the wick-primary cohort over the Apr 2025–Apr 2026 backtest window (37 of ~45 instruments, ex. low-correlation crosses recently dropped to improve aggregate quality).
- **~45 instruments live** — FX majors, minors, crosses, XAU/XAG, BRENT, DAX/FTSE/DJ/NAS/SPX/CAC/Nikkei, BTC + 9 alt-coins.
- **Engine, alerts and backtest reconcile to the same rule set** — every change has a fingerprint, every subscriber can audit.
- **Public dashboard, zero paywall today** — early audience building, no churn risk at conversion.
- **Supabase + Telegram pipeline already in place** — auth, profile, alert-class preferences, admin gate. Subscription monetisation is the next switch flip, not a re-architecture.

Where the money goes

We are looking for early-stage capital to:

- Stand up the paid tier (Stripe + Supabase entitlement plumbing already scoped; ~2 weeks to launch).
- Triple the instrument coverage (US equities, top-50 crypto, more indices) — each new pair = a new audience segment.
- Marketing: SEO, content, paid acquisition through the free-dashboard funnel. The free product is the lead magnet.
- Hire one quant engineer to extend the failure-mode panel into a public research engine — convert the auditable history into earned authority.

Why now

Retail trader trust in black-box signal services is at a multi-year low — every prop-firm scandal and Telegram-rug story compounds it. The market is ready for a verifiable, open-engine alternative. We have the engine. We are 12 months into building the auditable history that becomes uncloneable.

The product is live. The math is open. The next 90 days are about turning that into a subscription business.
